SPRING WASHERS *(Continued)*

The principal types of Spring Washers are Crescent (Cylindrically Curved), Wave (Marcel, Wavy), and Conical Spring (Belleville). These are illustrated below.

TYPE	DESCRIPTION	APPROXIMATE LOAD CAPACITIES	SPRING RATE	MAXIMUM PERMISSIBLE DEFLECTION
Crescent Washers (Cylindrically Curved)		0-100 lbs.	Approx. linear over entire deflection range	Approximately 30% of outside diameter
Wave Washers		2-200 lbs.	Approx. linear except near flat position	Approximately 6% of inside diameter
Conical Washers (Belleville)		10-2,000 lbs.	Can provide: 1. Linear 2. Increasing 3. Decreasing 4. Zero 5. Negative	Approximately 10% of washer sidewall

Spring Washers are commonly used to apply a predetermined force on adjacent members in an assembly. Consequently, these washers are fabricated to meet close load, deflection, and size tolerances.

The dimensions given in the catalog apply when the Spring Washers are in the formed condition. Since they will expand slightly when deflected, space must be provided for this expansion. For these washers to function properly, the mating surfaces must be such as to allow the washer's contact surfaces to slide freely. If the mating surfaces are soft or rough, consider using a flat washer for the spring washer to slide on.

Some of their specific uses are to dampen vibrations, eliminate side or end play, control end pressure, keep fasteners secure, accommodate thermal or pressure expansion and contractions, apply drag or resistance to turning, and many other compression spring applications.

Several advantages over coil springs are price, ability to accommodate high loads in small spaces, weight reduction, etc., and with Conical Spring (Belleville) washers one can provide a linear spring rate, an increasing spring rate, a decreasing spring rate, a zero spring rate, or a negative spring rate.

The selection of a particular type of Spring Washer depends on the application in terms of space available and deflection and load characteristics required. In certain cases any one of the three basic types will serve equally as well. In other situations the particular characteristics required will dictate the selection. Some typical applications are shown on page 85.

SPRING WASHERS *(Continued)*

Spring Washers used for pre-loading are often designed so that the stress at the test or rated height is within the yield strength. However deflection beyond that height will cause a permanent set or flattening. Therefore they should not be used beyond the test or rated height.

Where more deflection is required than can be obtained from a single Spring Washer they may be used in series to obtain the desired deflection. In this arrangement a rigid flat washer is used between each Wave or Crescent washer. (See Figure 1a.) Conical (Belleville) Spring Washers do not require a flat washer when stacked in series.

Where more load is required than can be provided by a single Spring Washer they can also be assembled in parallel. In this arrangement the load is increased in approximate proportion to the number of washers used. (See Figure 1b.)

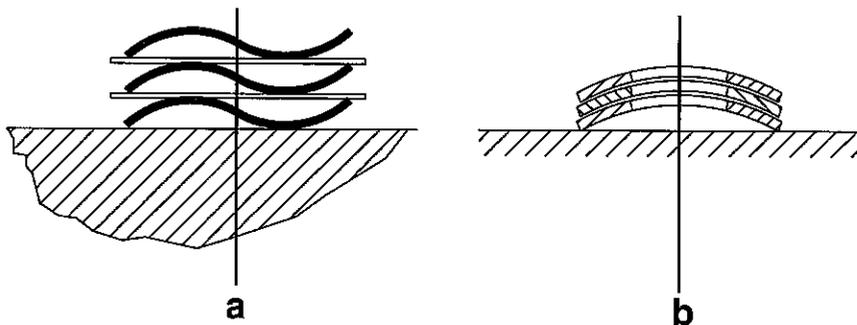

FIGURE 1

Stacking in series and parallel as shown in Figure 2c will both increase the load capacity and increase the deflection. The load will be increased in proportion to the number of washers stacked in parallel in one set. The deflection will be increased in proportion to the number of sets of washers. To illustrate, consider that all of the stacks in Figure 2 are made from a basic washer which provides 25 pounds of load with .020 inch deflection. Figure 2a would give 25 pounds with .100 inch deflection. Figure 2b would give 75 pounds with .020 inch deflection and Figure 2c would give 50 pounds with .060 inch deflection. This use of spring washers sometimes makes it possible to use one basic spring in different applications by combining the washers in various ways.

SPRING WASHERS *(Continued)*

Below are suggestions for stacking spring washers.

1. The stack must be guided. This can be done either on the inside diameter or outside diameter.
2. Buckling tends to occur when stacked heights are excessive causing friction on the guide. Stacked heights in the free position should not be greater than the outside diameter of the washer.
3. When spring washers are stacked in parallel, the load capacity may be adversely affected by friction between the washer, especially with heavy loads or where more than three are stacked together. A lubricant reduces this effect.

CRESCENT SPRING WASHERS (CYLINDRICALLY CURVED)

This is the simplest and most commonly used spring washer. It is designed to have the greatest deflection for its size compared to the other two types. It also has linear spring rate over its total range of deflection. The maximum design height for this type of spring washer should be less than one third the outside diameter.

This spring is best suited for applications which require flexibility, frequent load cycling, and light loads.

WAVE SPRING WASHERS

Wave washers normally have 3 waves, but they can be made with 4 waves, 6 waves, or more, depending on design requirements. By increasing the number of waves, the strength of the washer is increased. This usually decreases the amount of deflection permissible because of radial stress.

A small number of waves using thicker material is generally preferable to more waves with thinner material, because the stress is less.

Selection of a narrow sidewall with a smooth shallow form provides a spring with good flexibility but not much resistance to deflection. Selection of a wide radial width and/or steep form provides a stronger spring with much higher resistance to deflection.

Some rules to follow when selecting a 3 Wave Spring Washer required to deflect to the flat condition, are shown in Figure 3.

WAVE SPRING WASHERS — DESIGN CRITERIA

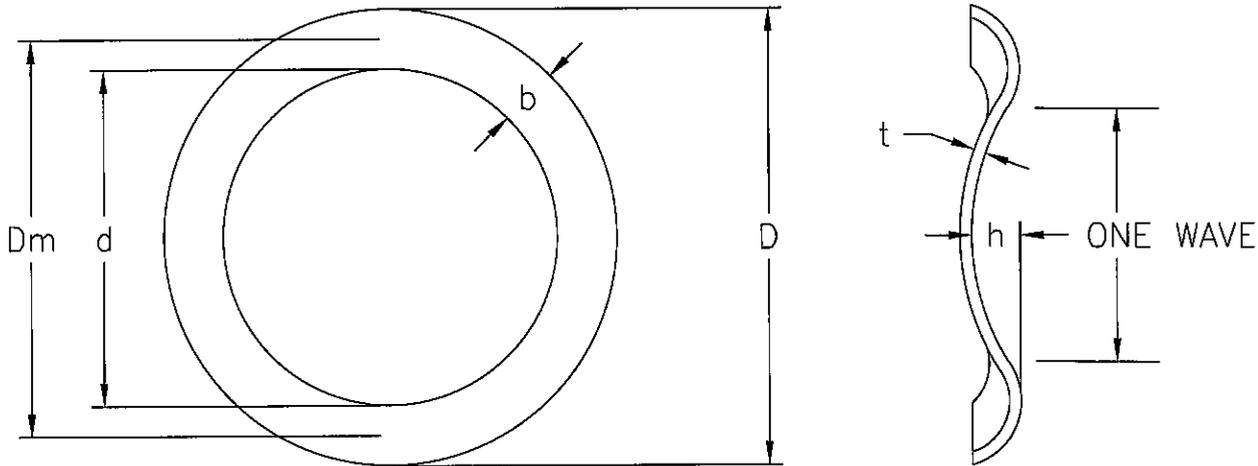

FIGURE 3.

$$\frac{D_m}{b} = 8 \text{ or more}$$

$$\frac{d}{h} = 16 \text{ or more}$$

A mean diameter to sidewall ratio of 8 or more will produce a nice flexible three wave spring washer. If the ratio is less than 8, the washer will be stronger, but it may deform when deflected to the flat condition.

Also, if a three wave washer must be compressed to the flat condition the maximum height must not be more than 1/16 of the inside diameter.

The true load deflection rate for these washers does not start until the waves are evenly loaded with an initial pre-load. They will then have a relatively linear spring rate from pre-load to 80% of designed maximum deflection.

This type of spring washer is used primarily for requirements where the load is static or the working range is small and the amount of axial space is limited.

CONICAL SPRING WASHERS (BELLEVILLE)

Conical spring washers have the least deflection for their size compared to the other two types of spring washers. They also have the highest load carrying capacity.

This type of washer is used where applications require high loads, small deflection, and where the amount of axial space is limited.

A Belleville washer is a specially designed conical spring washer that will not take a permanent set when deflected to the flat condition. Many times conical spring washers are designed with dimensions which will not allow deflection to the flat condition. These are used for applications which require high loads and very small amounts of deflection.

In order to depress Belleville washers to the flat condition the following conditions must be met. Please refer to Figure 4.

1. $\frac{h}{b} < .1$
2. $\frac{t}{b} = .1$ to $.2$
3. $\frac{O.D.}{I.D.} = 1.7$ to 2

CONICAL WASHERS (BELLEVILLE) — DESIGN CRITERIA

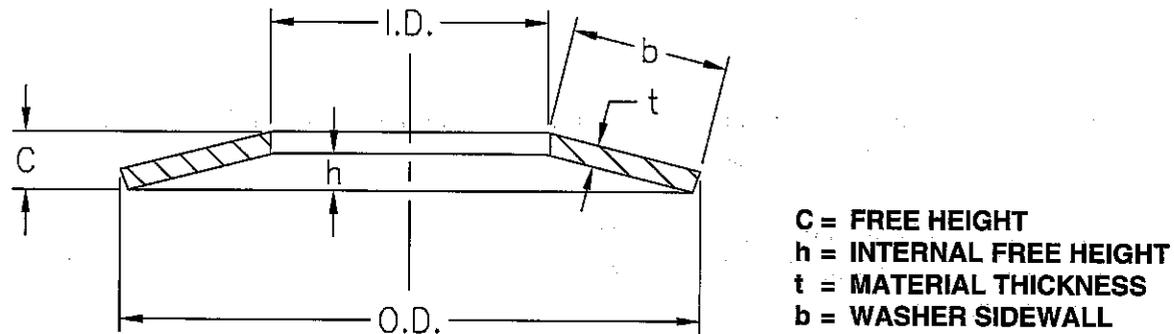

FIGURE 4

CONICAL WASHERS (BELLEVILLE) — DESIGN CRITERIA *(Continued)*

To design a conical spring washer for a particular application please refer to the chart on Page 84 and the chart below.

If the h/t Ratio is:	Spring Rate is: (From relaxed condition to flattened position)
.4	Linear and positive.
.4 - 1.41	Positive, but rate of increase diminishes as washer is deflected.
1.3 - 1.5	Initially positive, but approaches zero from 60% to 90% deflection.
1.41 - 2.83	Initially positive, then zero, then negative. These washers will "oil can" through the flat position.
> 2.83	Initially positive, then zero, then negative. These washers will snap inside out through the flat position and will require the same force to snap back to its original position.

Springs with an h/t ratio greater than 1.3 should not be stacked in series if deflection may approach the flat condition. Because of variables in the manufacturing, one or more washers may snap flat and cause erratic loading.

The charts above and on Page 84 are correct over their entire range for washers that are designed to be deflected to the flat position (Belleville type).

Washers that require very high loads and very little deflection are not designed to be deflected flat. These will follow the chart only within their designed range.

These charts will predict performance reasonably well for deflections of less than 80%. If accurate loads are required, the washer should be designed to reach the desired load before 80% deflection is reached.

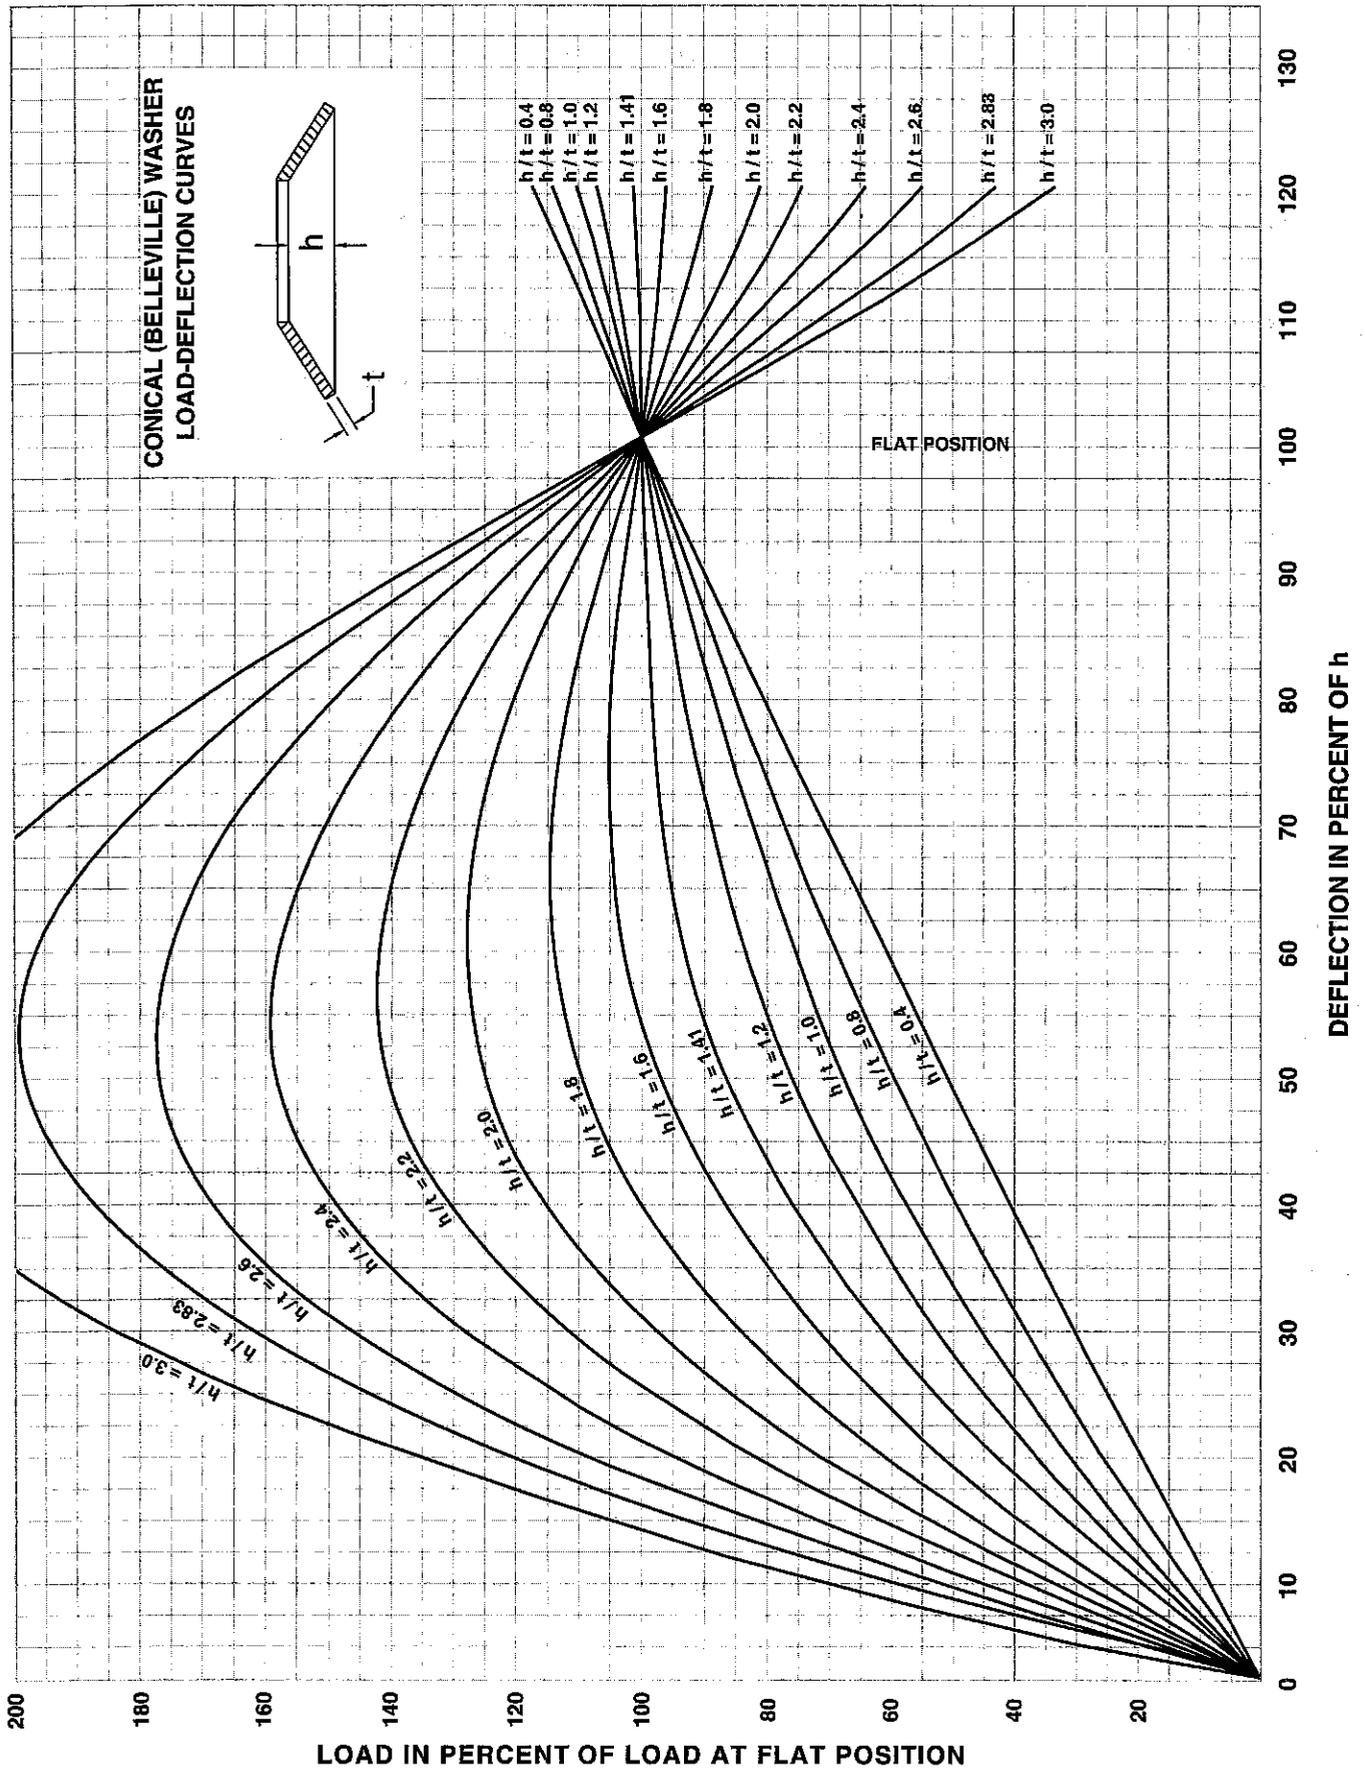

A Conical Spring Washer will carry more load if:

1. The material thickness is increased.
2. The h/t ratio is increased.
3. The O.D. / I.D. ratio is increased

Generally these variables will also decrease the percentage of allowable deflection because of stress build-up around the inside diameter.

CONICAL STYLE SPRING WASHER (BELLEVILLE) LOAD-DEFLECTION CURVES

CAPACITY RATINGS — SEASTROM SPRING WASHERS

(REFER TO RATINGS CAPACITY COLUMNS IN CATALOG SECTION)

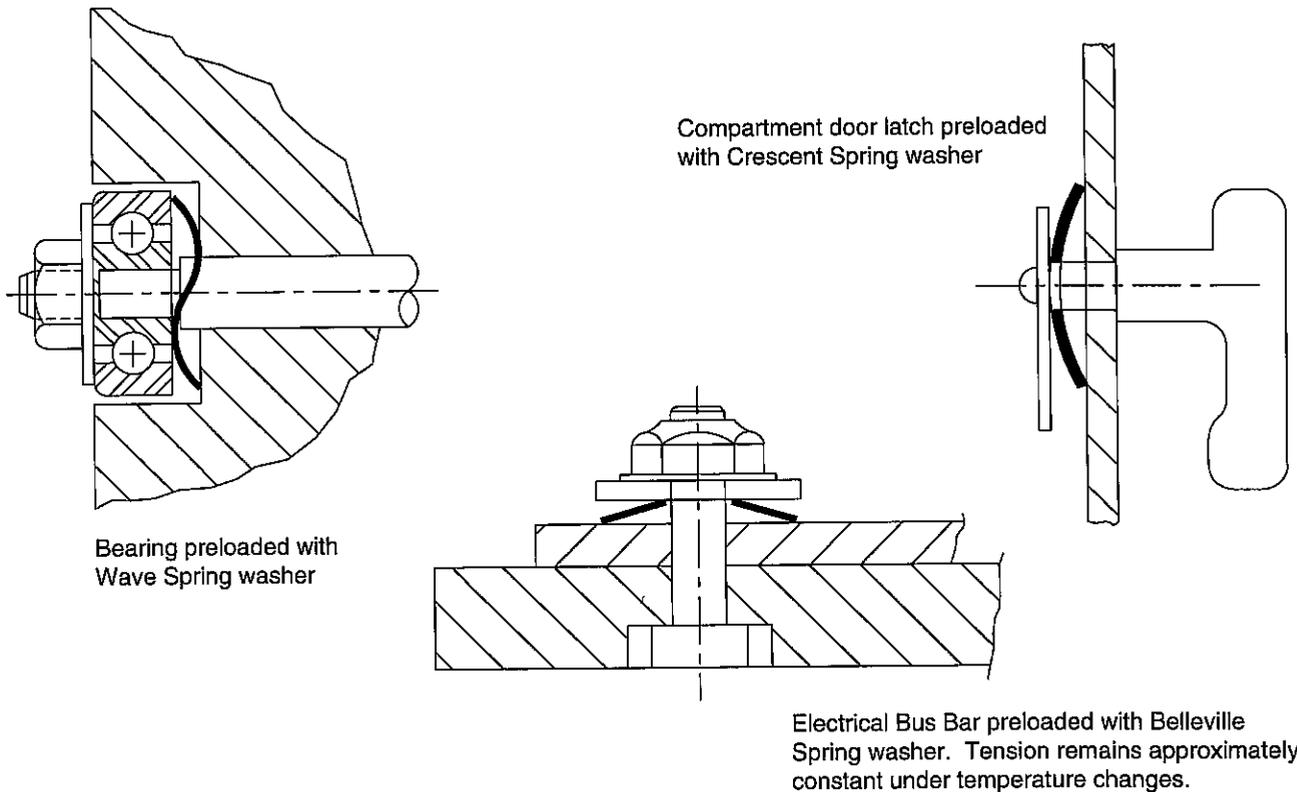

The Values for "Maximum Load", "Maximum Deflection", "Load at Flat", and "Spring Rate" are calculated for Spring Washers made to the nominal dimensions given in the catalog. Due to variations in material properties and manufacturing tolerances these values are **not** guaranteed and are offered as design guide information only.

Values are calculated for static loads. For dynamic loading these values will be less.

For conical (Belleville) Spring Washers, the load at flat may be less than the maximum load if the h/t ratio is greater than 1.41, see curves on page 84.

Before testing Spring Washers, it is always advisable to load the Washers several times through the specified working deflection to eliminate any set which might take place.

* Nominal as stamped. Some distortion may occur in Heat Treatment.

** The "A" and "B" dimensions must be measured with plug and ring gages because they are not perfectly round.

The Free Height ("C" dimension) of a Wave Washer is measured by placing it between two parallel plates and compressing it until all lobes are in contact with the plates. The measured distance between the plates is the Free Height as related to the stated catalog dimension and tolerance for it.

CRESCENT SHAPE SPRING WASHER (Continued)

Custom Sizes Available . . . See Last Page of This Section

NOTE: Unless stated, all catalog parts are supplied without finish. See page 545 for specifying finishes.

* ADD TO PART NUMBER

- 1 for beryllium copper
- 2 for spring steel
- 3 for stainless steel (17-7PH)

WAVE SHAPE SPRING WASHER

Custom Sizes Available . . . See Last Page of This Section

NOTE: Unless stated, all catalog parts are supplied without finish. See page 545 for specifying finishes.

* ADD TO PART NUMBER
 -1 for beryllium copper
 -2 for spring steel
 -3 for stainless steel (17-7PH)

HOW TO REQUEST A FAX QUOTE:

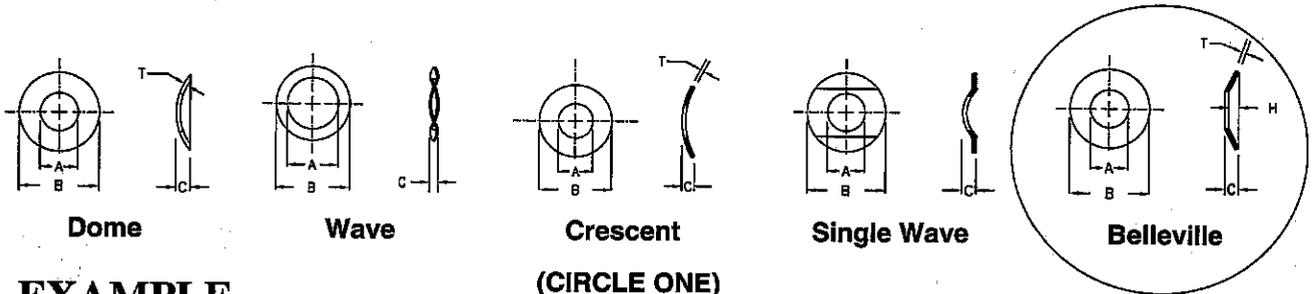

CUSTOM SPRING WASHERS

If your application requires a custom spring washer with dimensions not listed in this catalog, simply photocopy the adjoining page, fill in all necessary dimensions, and fax it to us at 208-734-7222. It's that simple!

Seastrom Manufacturing can manufacture virtually any custom spring washer you require.

For more information on spring washer applications, spring rates or design criteria, please refer to the front of the Spring Washer section.

If the custom configuration you require is different than shown on the adjoining page, please refer to the Custom Parts section for a fax quote cover sheet and a blank print to sketch your own design.

EXAMPLE

A: <u>.255</u>	B: <u>.870</u>	C: <u>.110</u>
T: <u>.062</u>	# Of Waves: _____	

If we can answer any questions concerning your custom spring washer needs, please feel free to call us today at 1-800-634-2356.

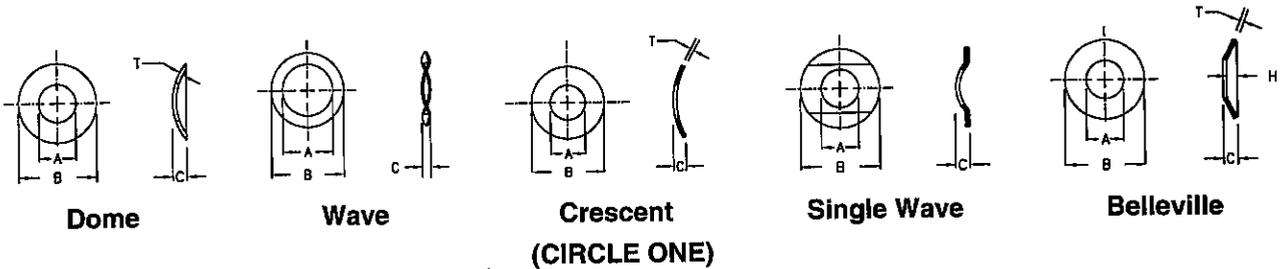

FAX QUOTE

CUSTOM SPRING WASHERS

PLEASE FAX TO:

SEASTROM MANUFACTURING COMPANY, INC. 208•734•7222

ATTENTION: Inside Sales
